Solution scattering gives single-molecule diffraction, but orientationally averaged

Aligned molecules yield a single-molecule pattern

How well aligned do you need?

photosystem II

 $\Delta \phi = d/w$

 $d = 3\text{\AA}$ $w = 160\text{\AA}$ $\Delta \phi = 1.1^{\circ}$

Even bad crystals should attain the required level of alignment

$$d = 2\pi \sqrt{\langle D^2 \rangle}$$

$$d = 5 \text{\AA}$$

$$\sqrt{\langle D^2 \rangle} = 0.8 \text{\AA}$$

Extended Data Figure 2 | Background corrected diffraction pattern of a photosystem II microcrystal

Kuptiz et al, Nature **513**, 261 (2014)

Even bad crystals should attain the required level of alignment

したととととと ししししししし ししししししし ととととととと しししたとしし ししししししし ししししししし $\langle I(\mathbf{q})\rangle = |f(\mathbf{q})|^2 \exp(-q^2 \sigma^2) + \sum f_i^2 \left(1 - \exp(-q^2 \sigma^2)\right)$

l

 $\sigma^2 = \left\langle D^2 \right\rangle$

Crystal diffraction is sensitive to atomic displacements

Even bad crystals should attain the required level of alignment

$$d = 2\pi \sqrt{\langle D^2 \rangle}$$

$$d = 5 \text{\AA}$$

$$\sqrt{\langle D^2 \rangle} = 0.8 \text{\AA}$$

Extended Data Figure 2 | Background corrected diffraction pattern of a photosystem II microcrystal

Kuptiz et al, Nature **513**, 261 (2014)

You can see a lot just by looking

By averaging thousands of patterns, a strong single molecule diffraction pattern emerges

By averaging thousands of patterns a strong single molecule diffraction pattern emerges

The orientational symmetry of the crystal is preserved, but not the translational symmetry

The rigid-body unit is consistent with the photosystem II dimer

We performed iterative phasing of the "single molecule" diffraction

Phasing pipeline:

- 1. Obtain 4.5 Å refinement from Bragg peaks
- 2. Generate a support
- 3. Iterative phasing to 3.3 Å (using Elser's difference map)
- 4. Improve the molecular model

Real space constraint

Reciprocal space constraint (nth iterate)

support

Elser, JOSA A 20 (2003) Elser & Millane, Acta Cryst A 64 (2008)

$$\tilde{\psi}_{n}'(\mathbf{q}) = \sqrt{\frac{I(\mathbf{q})}{\sum_{g} \left|\tilde{\psi}_{n}(g\mathbf{q})\right|^{2}}} \tilde{\psi}_{n}(\mathbf{q})$$

$$\tilde{\psi}_{n}(g\mathbf{q}) = 1$$

$$\tilde{\psi}_{n}(g\mathbf{q}) = 0$$

$$\dots$$

Kartik Ayyer

Electron density map from Bragg peaks alone (4.5 Å)

The low-resolution support constrains the phases

SCIENCE

Obtained by convolving 4.5 Å MR map with Gaussian of width 4.4 Å (i.e. 8.9 Å resolution)

Electron density map including continuous diffraction

The extended-resolution structure is superior

Higher diffraction sampling — model free phasing

- more reliable structure determination

Resolution not limited by the crystal, just detector extent and shots The best crystal is a "bad" crystal

Number of molecules per shot: $1 \mu m^3 \times 4 / (9.2 \times 10^6 \text{ Å}^3) = 4 \times 10^5$

The extended-resolution structure is superior

Higher diffraction sampling

- More information than required to describe the object
- model free phasing
- more reliable structure determination
- first new phasing since MAD

Resolution not limited by crystal quality, just detector extent and number of shots
