Single-particle Snapshots

XFEL

T4 Virus
Schlichting et al.

Cryo-EM

Chaperonin Molecule
Chiu et al.

Recover 3D structure from 2D snapshots

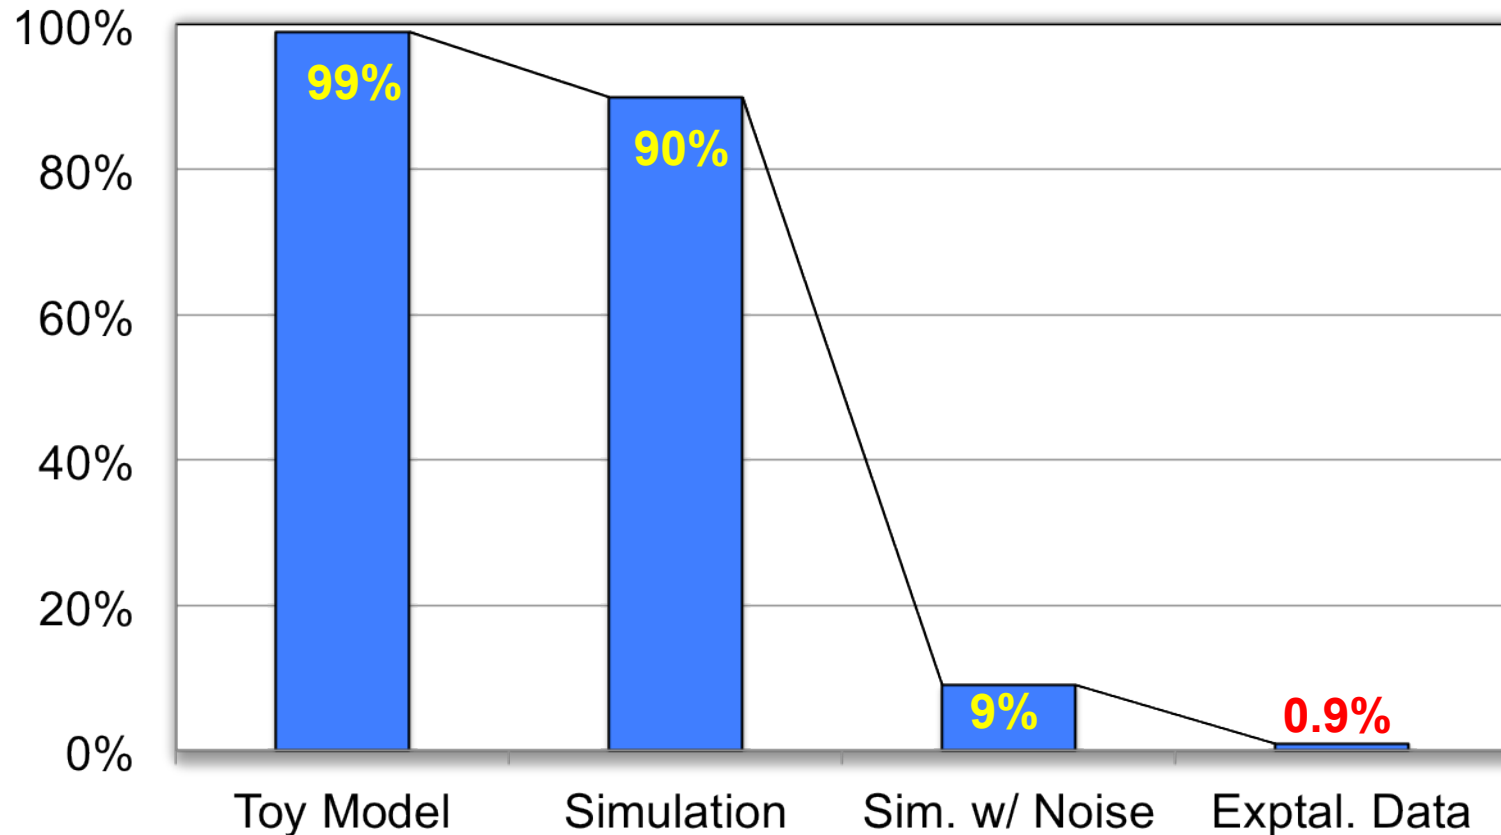

Structure vs. Nature

- **Radiation damage limits resolution**
 - Even in XFEL “scatter-then-destroy”
- **Spread the dose over many objects**
 - Crystallography, cryo-EM, XFEL
- **Reconstruct assuming identical objects**
 - If different, separate into sets of nearly identical objects
- **Heterogeneity common & fundamental; limits resolution!**
 - NOT low signal, or low scattering q
- **Heterogeneity implies dynamics**
 - In physics, chemistry, biology
- **New approaches for recovering structure & dynamics**
 - From random snapshots of heterogeneous ensembles

- **Single particles**
 - **Reconstruct homogeneous ensembles**
- **Molecular machines**
 - **Map conformations**
- **Dynamics**
 - **Time-resolved, strong-field reactions**
- **Conclusions**
 - **The ultimate “3D movie”?**
- **Simulated and experimental data**

Caveat Emptor!

Fraction of Successful Theories

Buyer beware!

Key Messages

- **Identical ensembles** (molecules, viruses, nanocrystals)
 - Can reconstruct at expected signal, or lower
 - Computation limits object size, heterogeneity limits resolution
 - Experimental issues with XFEL (intensity fluctuations, hit-rate, etc.)
 - 3Å resolution bar set by cryo-EM (*Science*, Aug. 27, 2010)

- **Heterogeneous ensembles** (molecular machines)
 - Can sort multiple discrete species and/or conformations
 - Way appears open to mapping conformations
 - *NJP* 12, 1 (2010); *Nature* 466, 329 (2010)

- **Dynamics** (ultrafast processes)
 - Reactions & their time evolution

- **Key tool**: Manifold mapping
 - Non-Bayesian graph theory

Identical Objects

3D structure from snapshots

Unknown orientation

Ultra-low signal

E. Coli Adenylate Kinase Reconstructed Electron Density

Simulation!

**2 million diffraction snapshots
 10^4 x higher complexity than previously possible**

Chaperonin Molecule

From Cryo-EM Snapshots

Simulation

Experiment; 20 e- /Å²

Processed Expt; 1.7 e- /Å²

3D reconstruction of single molecule at 12x lower dose than currently needed

Experiment!

Why Better?

- **Reconstruct your head with snapshots from random angles**
 - In a dark room, with flu
- **Standard methods sort snapshots into bins & average**
 - “Full frontals, not sneezing”
 - “Full frontal, sneezing a little”
 - “From the side, blowing nose” etc.
 - Lots of classes, each with few shots
- **BUT picture from back of head has info about full-frontal**
 - Shows where your ears are!
- **Manifold techniques exploit this “mutual information”**
 - Thrown away by classification methods

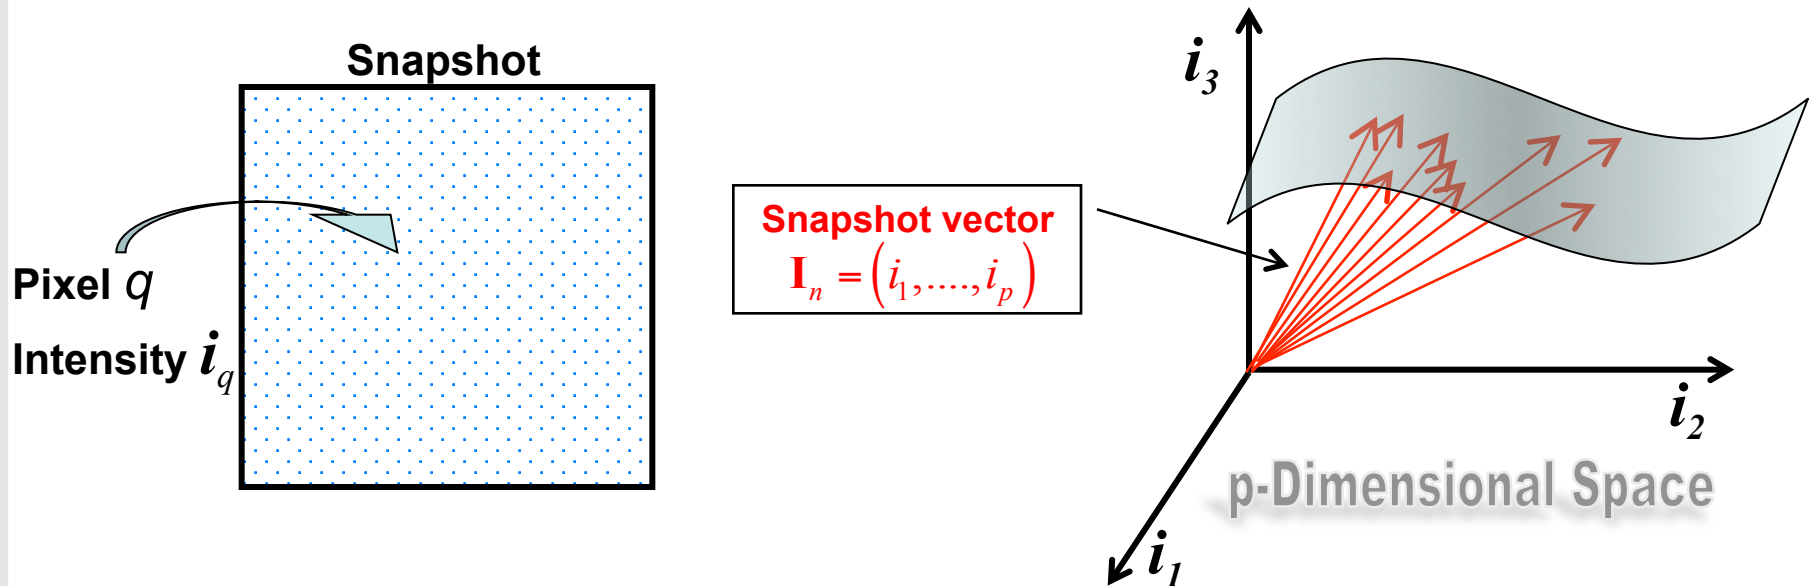

Ensemble of Non-identical Objects

Different Species and/or Distinct Conformations

“Post facto Purification”

Correlations as Manifolds

- All we have is ensemble of diffracted intensities
 - A snapshot is $\mathbf{I}_n = (i_1, \dots, i_p)$
 - Lives in p-dimensional “intensity space”
 - Correlations produce hypersurface (manifold)

Manifold-embedding vs. PCA

- Reveals intrinsic, nonlinear structure of data
 - Inaccessible to PCA
 - Varieties: Isomap, Diffusion Map, Riemannian embedding, etc.
 - Flavors: Isotropic kernel, anisotropic kernel

Discrete Conformations

Manifold 1

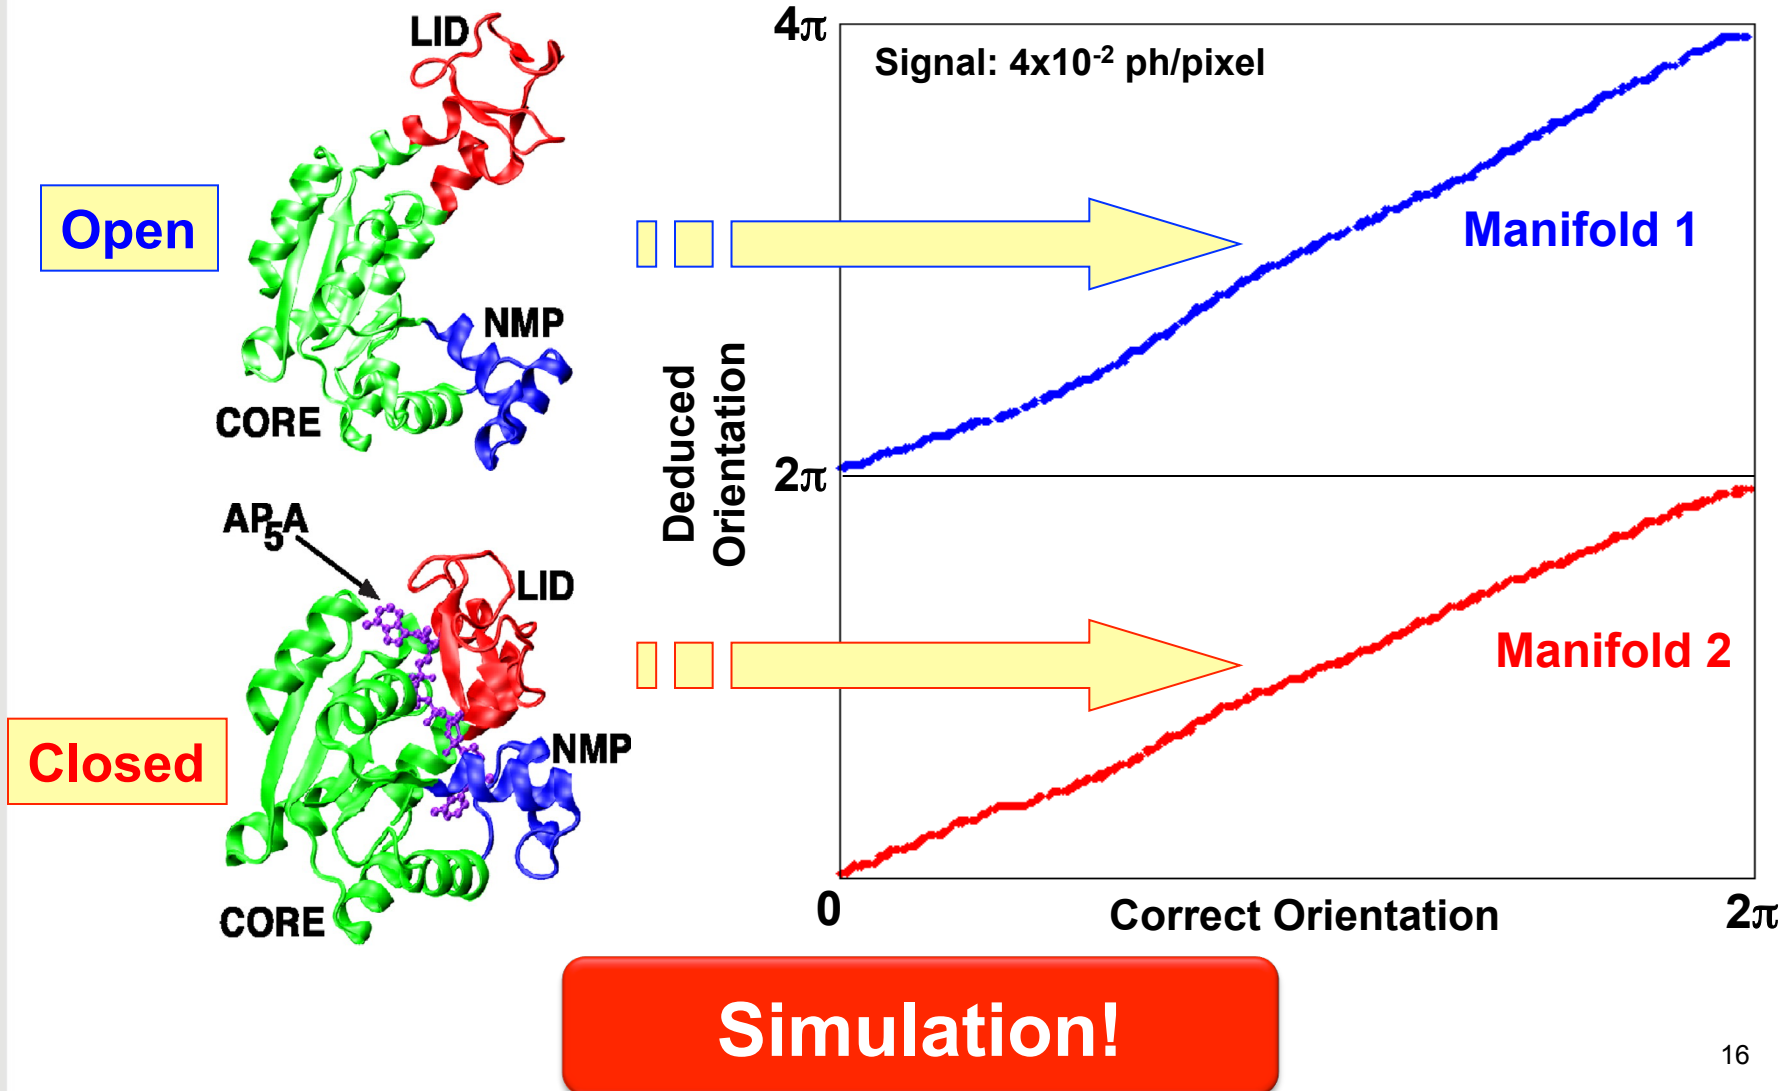

Manifold 2

Ensemble of Two Conformations

ADK Closed and Open

Separation Fidelity

Species 1

Species 2

- Separation fidelity determined by distance at closest approach
 - In standard deviations σ (“width of data cloud”)

<i>XFEL data</i>	<i>Separation</i>	<i>Remarks</i>
Simulated	$\sim 8.5\sigma$	0.04 photons/pixel
Experiment	$\sim 2\sigma$	Viruses, nano-rice (Optics Exp. Aug 2011)

Mapping Conformations

- Must identify **CORE** and **LID** and is **NMP** residues
- Navigate in specific directions on **conformational manifold**

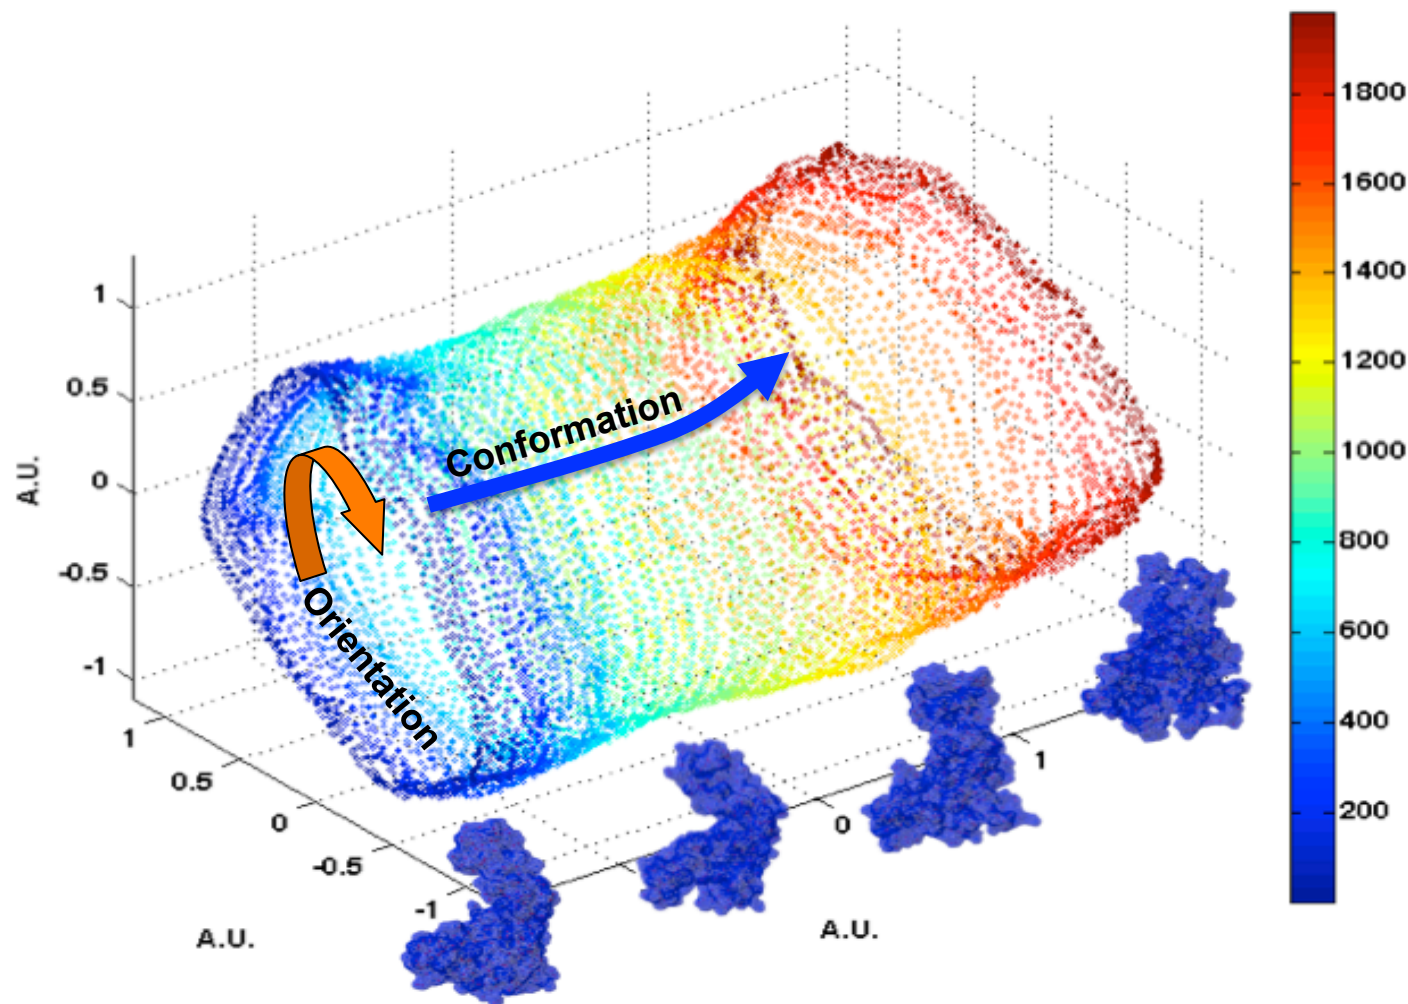

Navigating the Manifold

- I am an ant, crawling on the manifold
 - Riemannian approach: measure local rates of change
- Hitherto undiscovered symmetries provide compass
 - Symmetries of OPERATIONS in space, not objects!
 - Navigation = Perception!
- Applies to ALL manifolds produced by scattering
 - Giannakis, Schwander, Yoon, Ourmazd, <http://arxiv.org/abs/1009.5035>

Conformational Continua

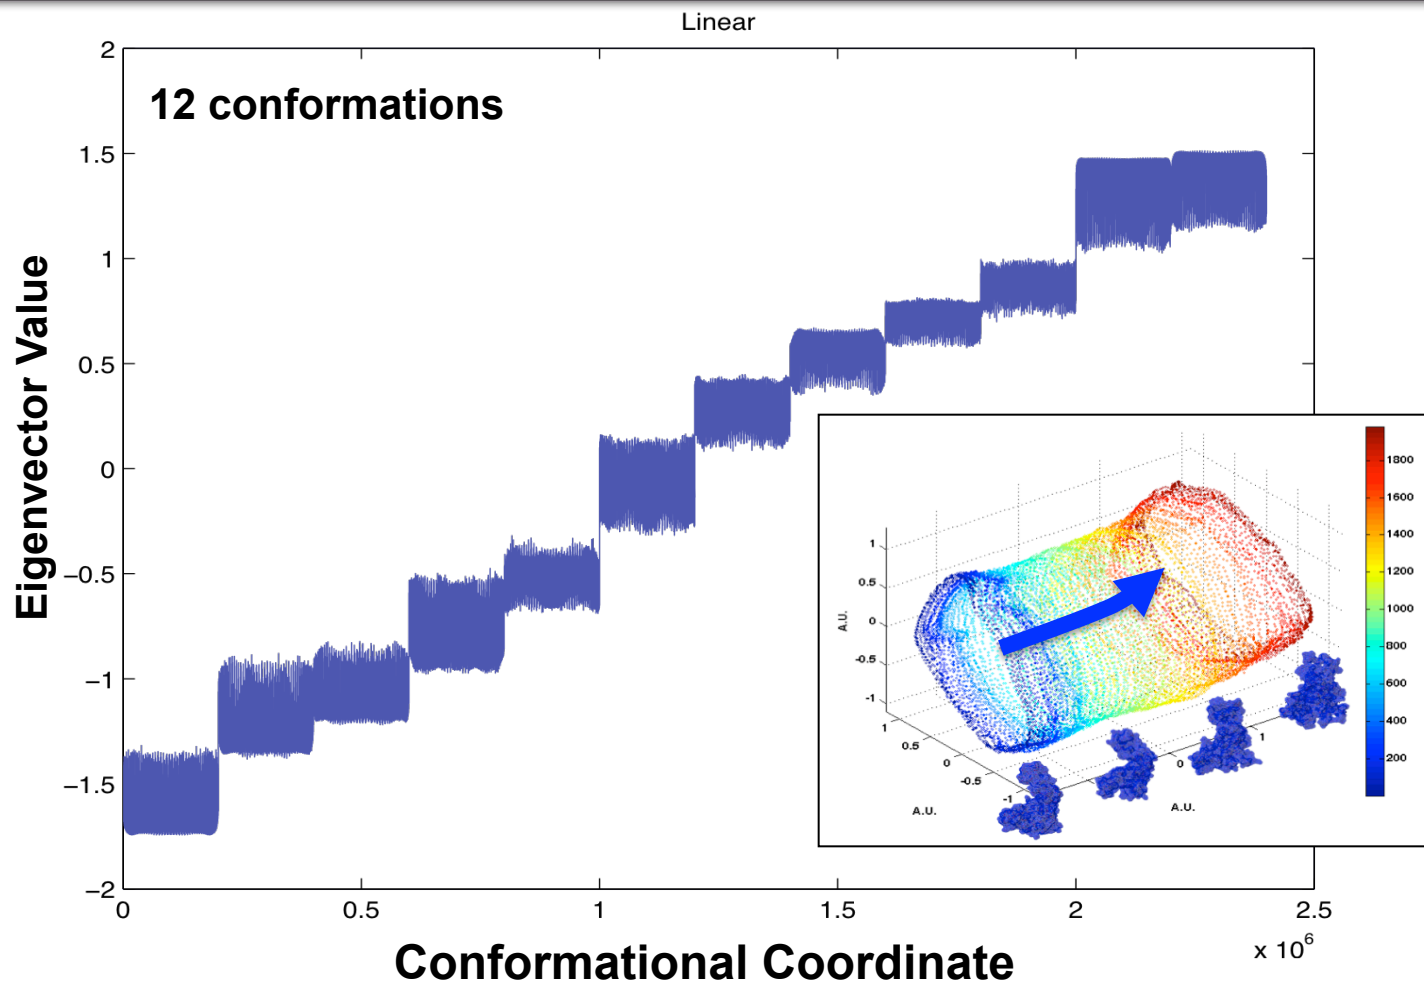

Unfolding of ADK: 850K, 5ns

Manifold formed by diffraction snapshots of melting ADK molecule

Conformational Continua

Melting ADK (Simulation)

Simulation; Work in progress!

Time Evolution

Rotating Object, SNR: -21dB

Time Evolution

Interacting Bodies, SNR:-11dB

Pump-probe at LCLS N₂ Coulomb Explosion

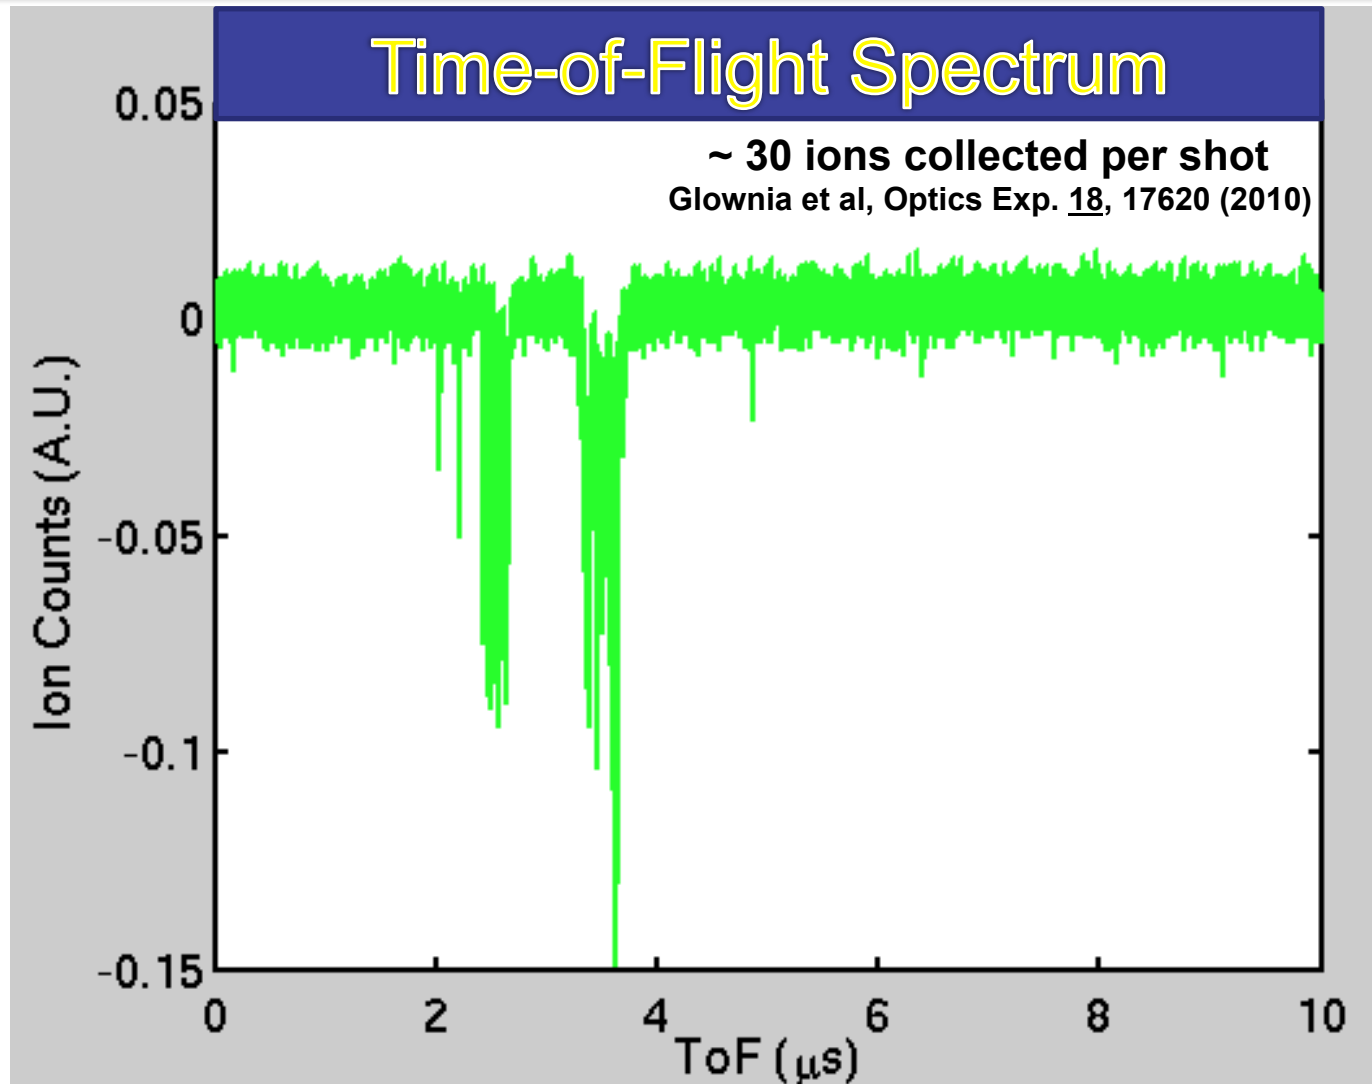

Time of Flight →

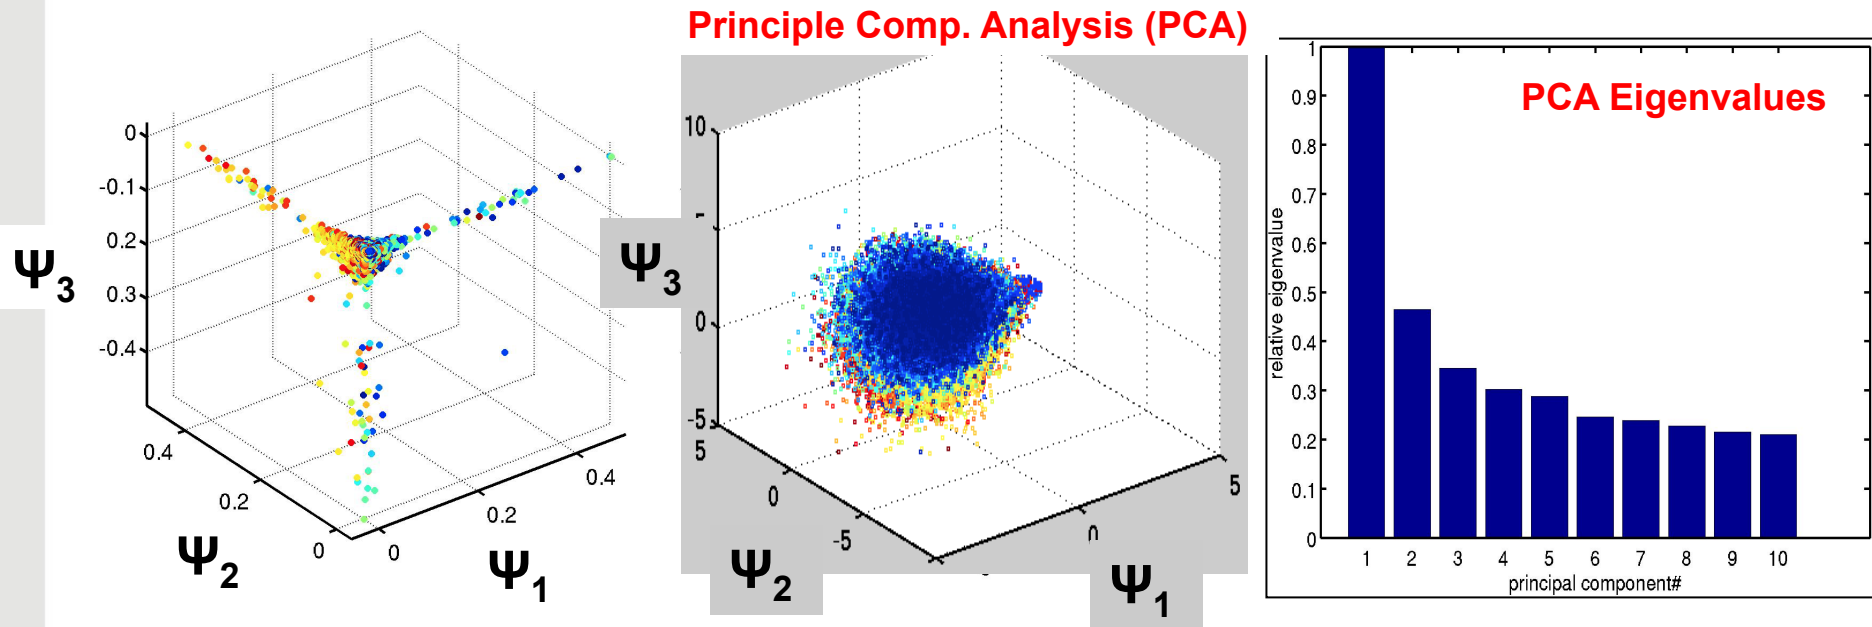

Timing jitter: 280fs FWHM

Glownia et al, Optics Exp. 18, 17620 (2010)

N₂ Coulomb Explosion

N₂ Coulomb Explosion Manifold Analysis

Experiment!

- **FIVE dimensions**
 - From eigenvalue spectrum, manifold structure
 - Standard (linear) PCA produces featureless blob
- **Each dimension an explosion channel**

N₂ Explosion Channels ToF Spectra from Manifold

Fine structure NOT noise

Experiment!

Autocorrelations

Different Delay Regimes

Negative Delay

Overlap Region

Positive Delay

Central peaks clipped

Pedestal: No correlated activity; Fine structure: Correlation

Pronounced fine structure when IR and X-ray pulses overlap

Femtosecond fine Structure Coherence between channels

Ψ_2

Diagonal: Autocorrelations
Off-diagonal: X-correlations

Simulated

Ψ_4

Ψ_5

Coherence between Channels

$$\Psi_2^* \Psi_3$$

X-correlation

FFT (Imaginary Part)

FFT (Real Part)

Conclusions & Outlook

- **Manifolds represent powerful new route to structure & dynamics**
 - Capture entire information content, exploit symmetries
 - Remove need for “identical objects”
- **Recover structure, separate species, map conformations**
 - From ultra-low signal , random snapshots
 - Applications from molecules to people
- **Femtosecond dynamics**
 - Despite (overwhelming) timing jitter
 - Structure and dynamics of ultrafast reactions (“3D movies”)
- **Potential route to new vistas**
 - Machine learning & symmetries of perception
 - Platonic Forms
